

Lecture 1: Introduction

Topics

- Aim, Objectives
- Mode of delivery
- What's a computer
 - **Fundamental model**
- Instruction Set Architecture (ISA)
 - **MIPS** [ARM, RISC-V, x86]
- Assembly programming
 - **SPIM** simulator, First SPIM program

Teaching Staff

- Subject/Unit Coordinator + Lecturer + Tutor:
Jamie Yang

Room ER.G.12, Parramatta

E-mail: j.yang@westernsydney.edu.au

Phone: 9685 9233

Aim

- Assumed knowledge:
 - as specified in the subject outline for pre-requisites
- This subject is designed for students:
 - interested in systems programming, and
 - interested in hardware development.
- Learn about the interface between the hardware and software of a computer system
 - this will involve study of some aspects of computer architecture
 - students will gain insight into CPU organisation at the assembly language level.

Pre-requisites/Co-requisites

COMP1005 Programming Fundamentals OR
Equivalent

MATH1006 Discrete Mathematics OR equivalent.

Computer architecture
CPU organisation
Assembly language

... ..

Aims

Systems programming

Hardware development

Objectives

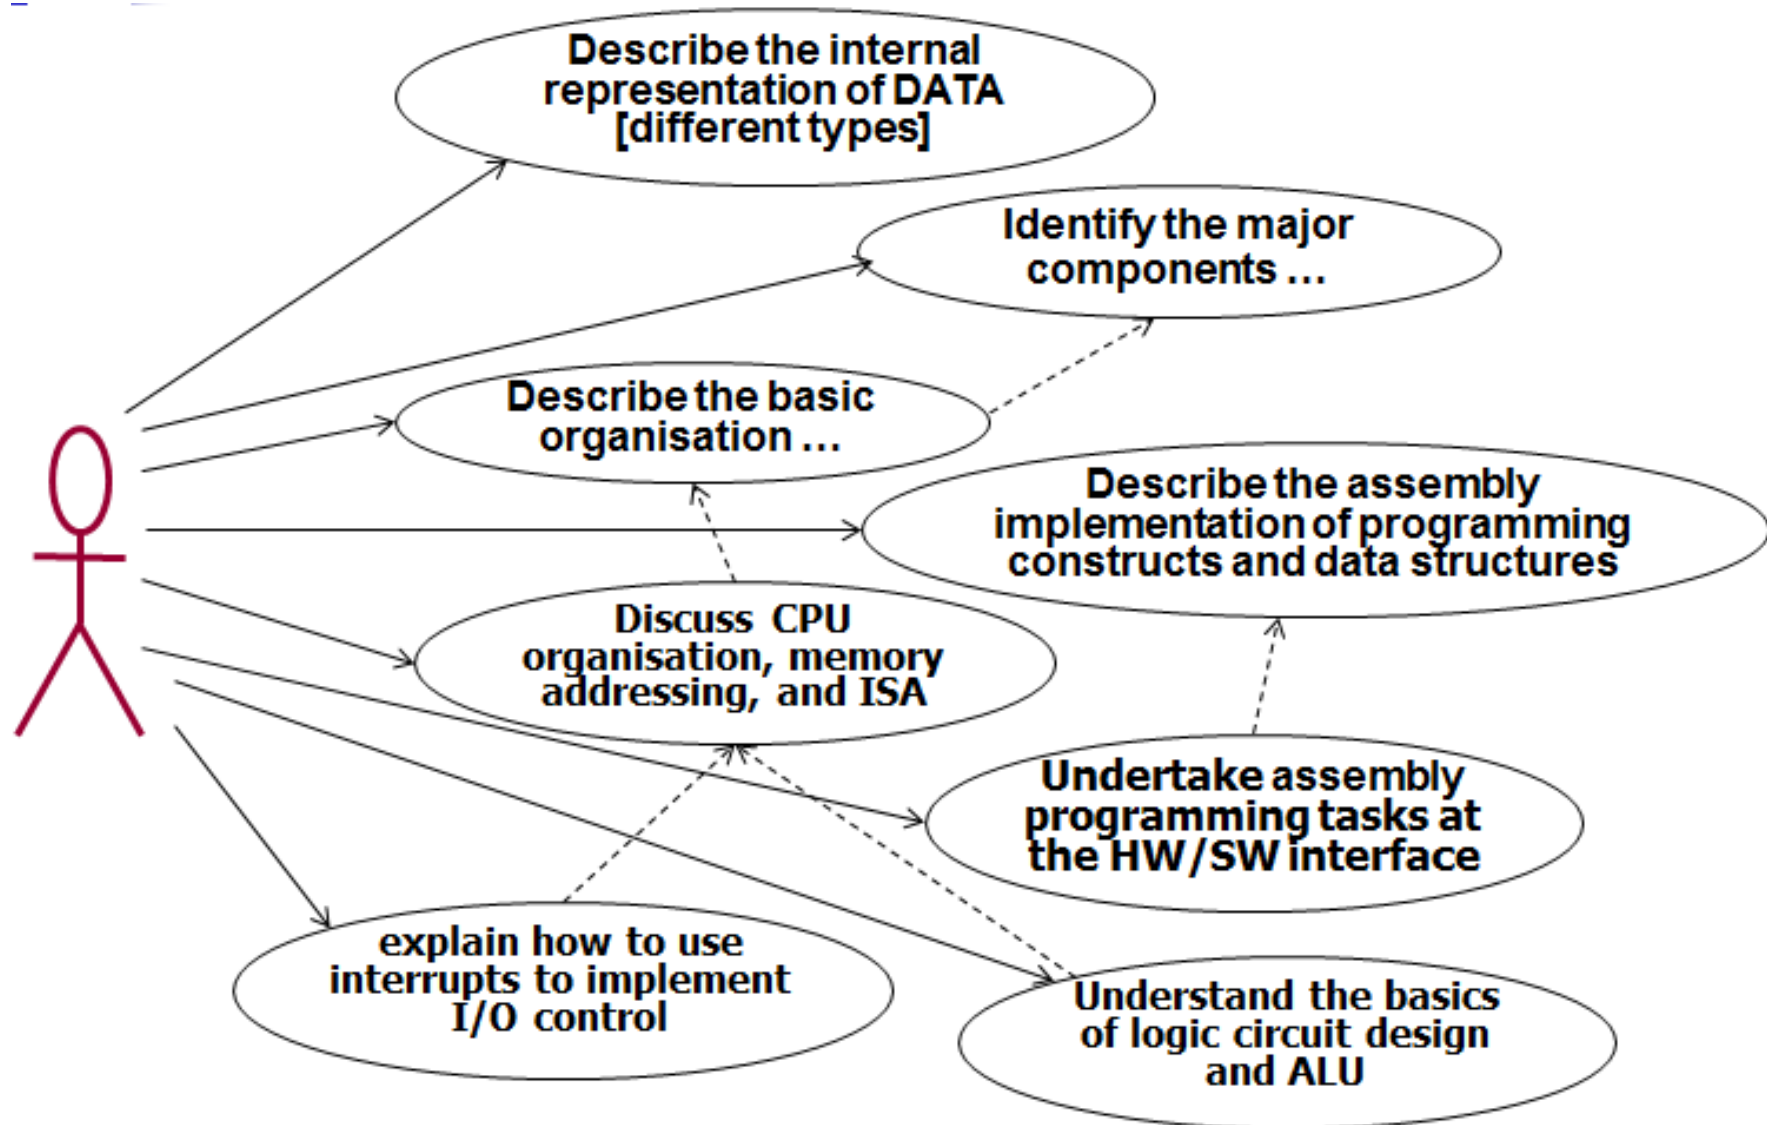

- Describe the internal representation of different types of data, and discuss the effects of fixed-length number representation on accuracy and precision.
- Identify the major components of a computer system, and describe the basic organisation of the von Neumann machine (data and instructions in the same memory).
- Describe how fundamental high-level programming constructs and data structures are implemented at the assembly language level.
- Discuss a simple CPU organisation and Instruction Set Architecture (ISA) design, including instruction formats, and addressing modes.

Objectives – cont.

- Undertake a programming task at the hardware/software interface, carry out such task in the assembly language programming of the example processor.
- Identify the hardware mechanisms which support interrupt/exception/trap handling, and explain how interrupts are used to implement I/O control.
- Understand the basics of logic circuit design, including fundamental building blocks, and minimisation of logic expressions using Karnaugh maps (K-maps).
- Construct ALU (Arithmetic Logic Unit) using logic gates.

Objectives (summary)

Learning outcomes

- After completing this subject students will be able to:
 - identify major components of a computer system,
 - describe representation of different types of data, and understand different number representations,
 - use fundamental high-level programming constructs and data structures, program at the hardware/software interface in the assembly language
 - understand a simple CPU organisation and Instruction Set Architecture (ISA) design, instruction formats, addressing modes,
 - explain how interrupts are used to implement I/O control, understand interrupt / exception / trap handling,
 - use mathematical expressions to describe the functions of simple combinational and sequential logic circuits, explain function of ALU.
- With small adjustment the skills and knowledge gained apply to any computer architecture and any computer organisation.

Mode of delivery

- Lectures: 1 x 2 hour per week
 - COME to lectures with lecture notes (printed or on-screen)
 - PLEASE behave so that others can listen
- Format
 - Lecture notes couldn't cover all the details
 - Some material may not be readily available elsewhere - expanded topics, sample exam questions, etc. will be explained during lectures, but are NOT included in provided notes
 - Some sub-topics will be set for self study
 - **Lecture recordings** available online for convenient access to the lecture contents

Mode of delivery – cont.

- Labs: 1 x 2 hour per week, starting week 2
 - Read a lab instructions, study recommended materials, and do the preparation BEFORE coming to the lab. When you start a lab you will get mark for preparation part (but not later).
 - If you come to a lab completely unprepared, you will waste your time, and risk getting mark 0
 - Be ready to ask questions, and get help from tutor
 - **Submit work on time** (extension policy refers to the subject learning guide)
- Format
 - 11 assessable tasks. No labs in intra session break.
 - No work will be accepted via e-mail
 - See lab 1 sheet for additional info

Assessment Structure

- Lecture Quizzes (in lecture) 10% = 2@5%
- Laboratory Work 40%
- Final Examination (open book) 50%

The Textbook

- **H**ennessy and **P**atterson “Computer Organization & Design” the best textbook of this type, used by hundreds of Universities. Now in 6th edition.
- Reference to Text:
 - Text HP6 (or PH6), Section 2.8 and Appendix A-22
 - Text HP4 (or PH4), Section 2.8 and Appendix B-22
 - Text HP2 (or PH2), Section 3.6 and Appendix A-22
- We do NOT go chapter by chapter, and NOT in sequence!
- Recommended: print **HP_AppA.pdf** (available on vUWS). It is 84 pages, but you will be using almost all of them, also during the exam (open book).

General Data	UnitOutline LearningGuide Teaching Schedule Aligning Assessments 
Extra Materials	ascii_chart.pdf bias_representation.pdf HP_AppA.pdf instruction decoding.pdf masking help.pdf PCSpim.pdf PCSpim Portable Version Library materials

- Print 2pgs/page and double sided?

Online Access (Table of Contents; Modules)

- **vUWS** will be used extensively as a means of getting information to students
- subject materials and announcements will be available online
- Check the subject website at least twice a week, and once before the lecture every week

General Data	UnitOutline LearningGuide TeachingSchedule Aligning Assessments 		
Extra Materials	ascii_chart.pdf bias_representation.pdf HP_AppA.pdf instruction_decoding.pdf masking_help.pdf PCSpim.pdf PCSpim Portable Version Library materials		
• Subject to later modifications if needed.			
Wk	Lecture Topic /* Lecture videos online  */	Practical Task Lab Sheet and Code	Others
/* Text readings are listed in Lecture Notes and in Learning Guide (see Teaching Activities) */			
1	Lect. 01: [Slide] Introduction: D structure. Basic compone	 A tabular organisation of the unit contents is more convenient for access. While you can browse individual modules listed below, you are recommended to check the "Table of Contents" link directly To Table of Contents (for the unit learning guide, teaching materials, and teaching activities)	
2	Lect. 02: [Slide] ISA-MIPS: MIPS	 Module 01 - Introduction: Detailed outline of the unit, approach to teaching, assessment structure.	
		 Module 02 - ISA-MIPS: MIPS assembly language, R, I, J instructions, decision making	
		 Module 03 - Addressing: Constants, addressing, loops, arrays and pointers, processing text

Recordings (Panopto)

Readings & Resources

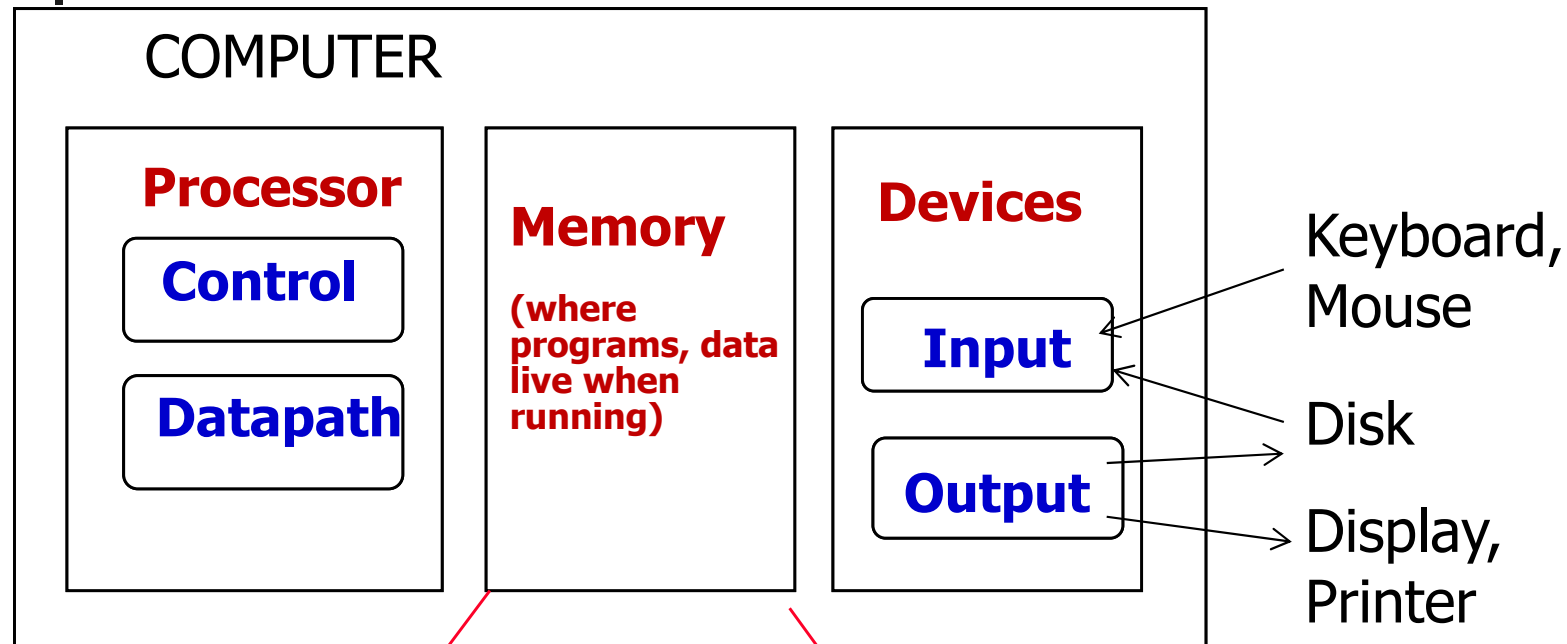

Major Components of a Computer

Major Components – More Details

Major Components – Alternative View

Road Map:

- Control: Chap 4, 6, Appendix C
- Datapath: Chap 3, 4, 6, Append C
- Memory: Chap 5
- I/O: Chap 5, 6

What is a computer?

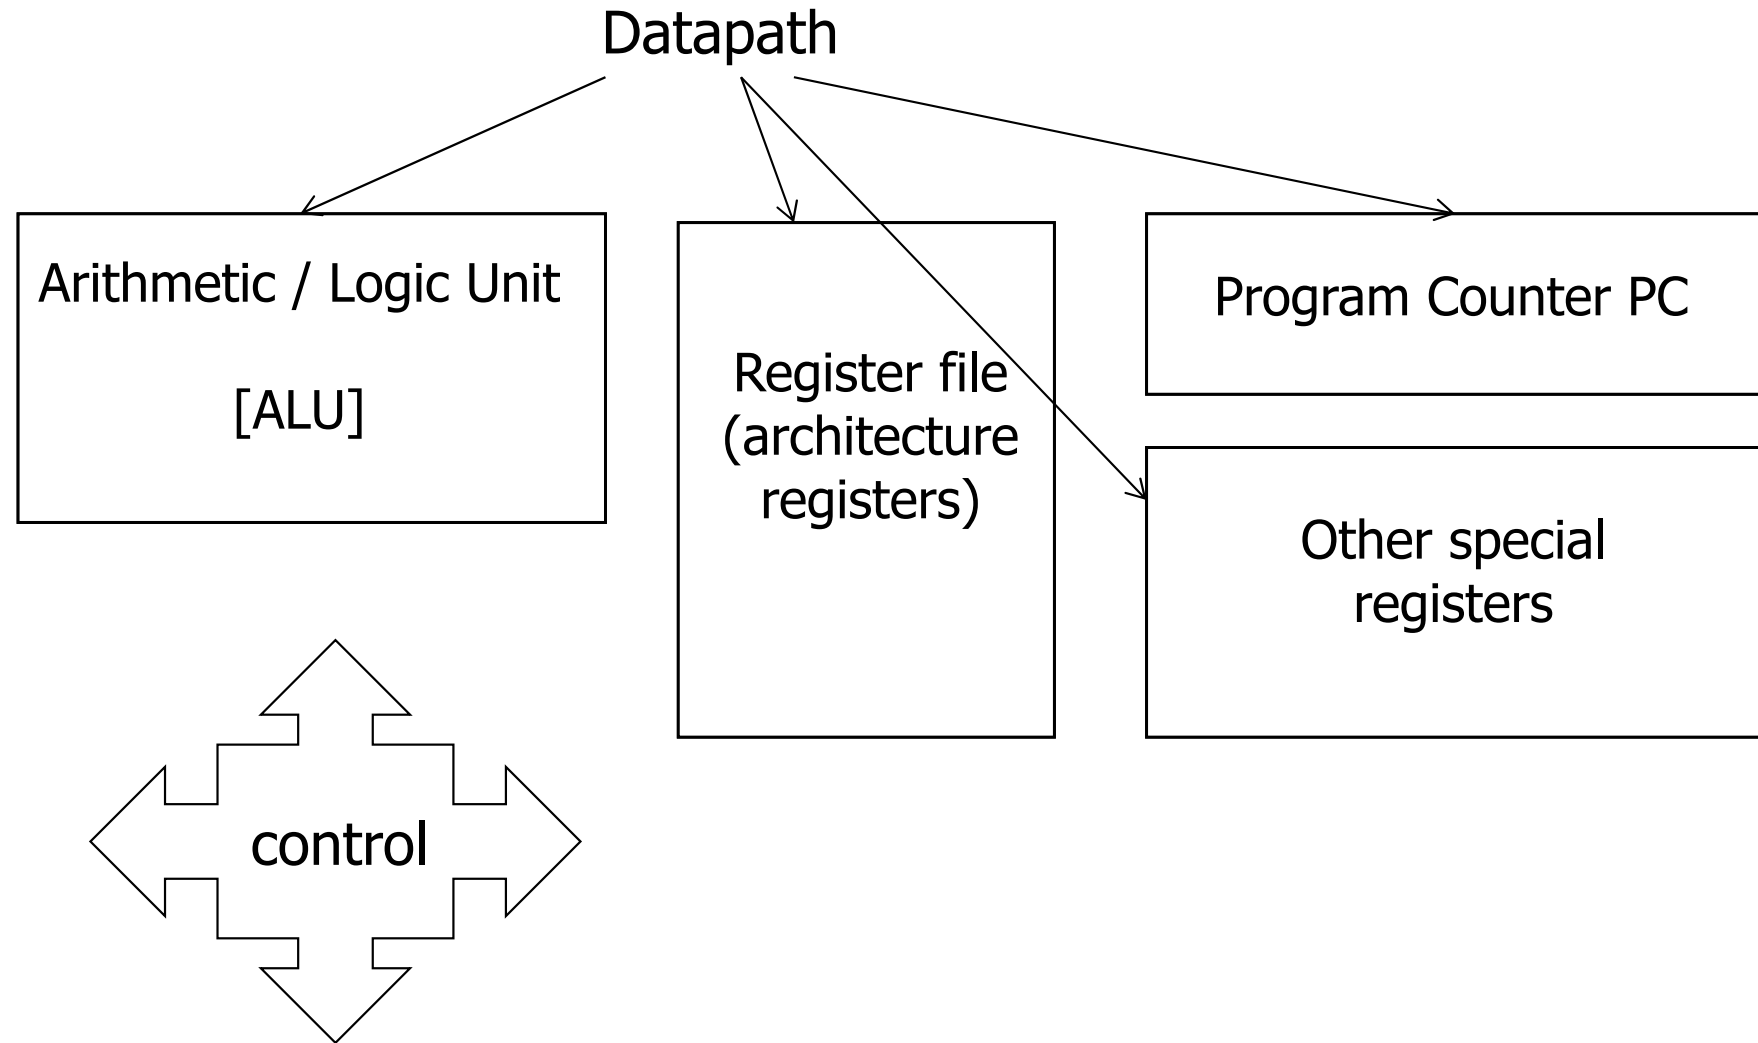

- Major components

- control (processor)
- datapath (processor)
- memory
- input
 - disk
 - keyboard
 - mouse
- output
 - disk
 - monitor
 - printer

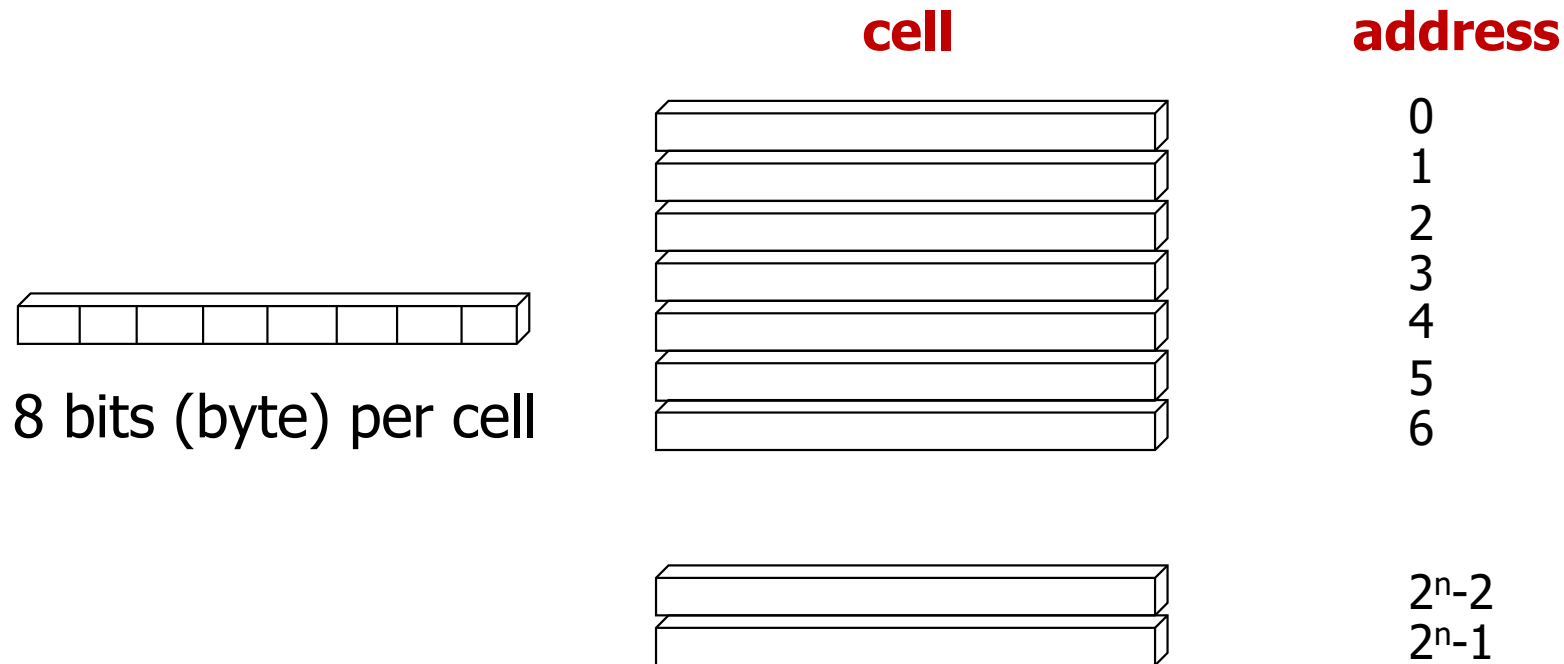

- Another view

- processor
- input (mouse, keyboard)
- output (display, printer)
- storage
 - main memory (DRAM, SRAM)
 - secondary (long-term) storage (disks, tapes etc)

Components of a processor

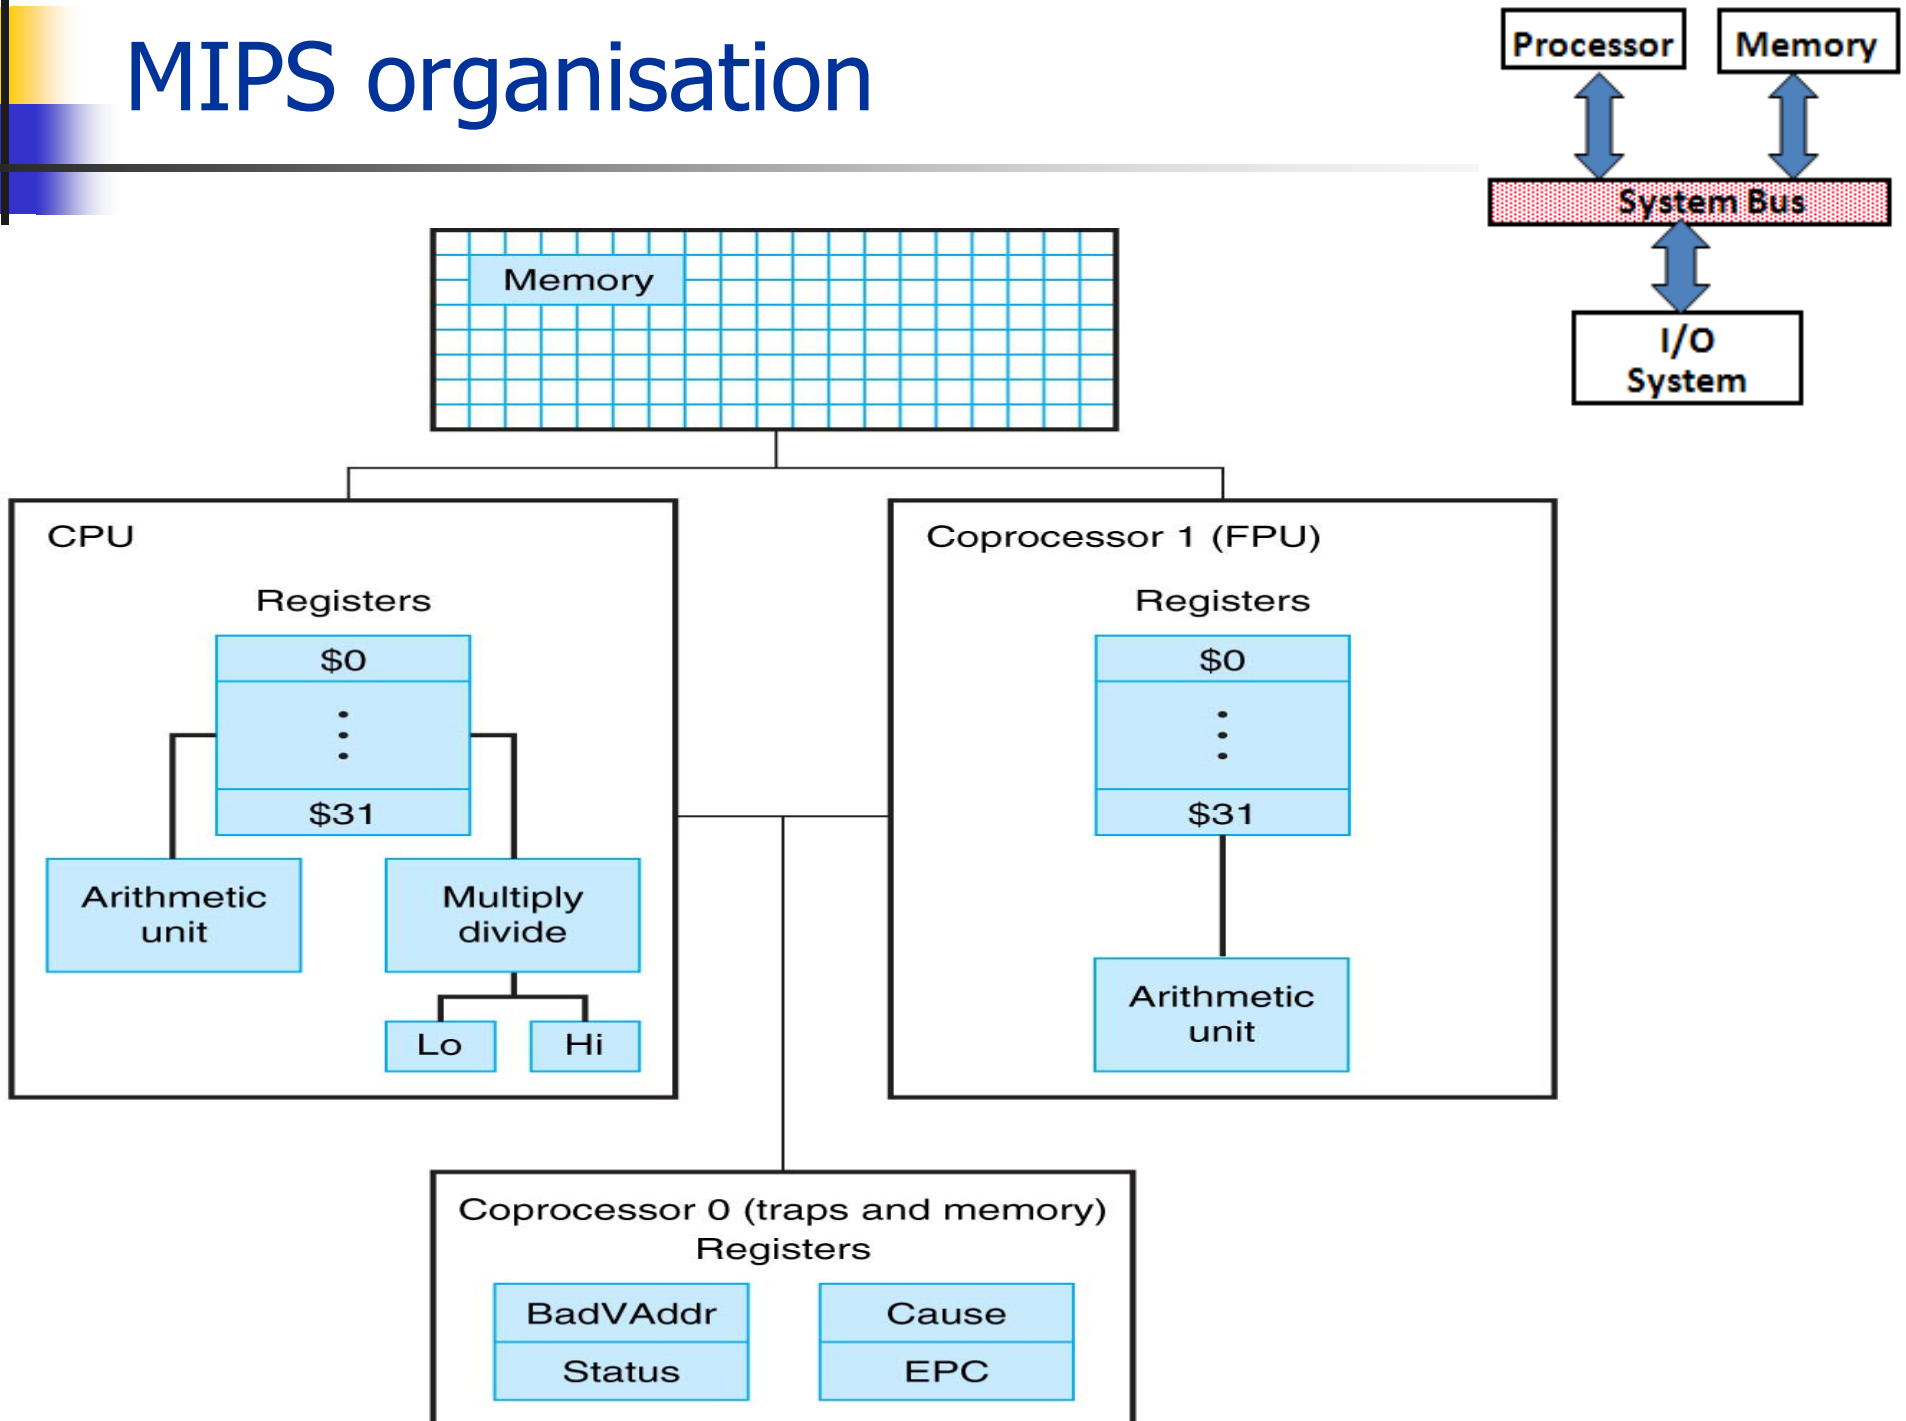

Memory abstraction

- **n** is word size (architecture size) in bits
 - 32-bit architecture ($2^{32} = 4G$); 64-bit architecture
- address space - total number of addresses available

MIPS organisation

Policy of Registers Use Convention

- Important – keep a copy of this page!

Name	Register Number	Usage	Preserve on call?
\$zero	0	constant 0 (hardware)	n.a.
\$at	1	reserved for assembler	n.a.
\$v0 - \$v1	2-3	returned values	no
\$a0 - \$a3	4-7	arguments	yes
\$t0 - \$t7	8-15	temporaries	no
\$s0 - \$s7	16-23	saved values(declared variables)	yes
\$t8 - \$t9	24-25	temporaries	no
\$k0, \$k1	26, 27	reserved for OS kernel	n.a.
\$gp	28	global pointer	yes
\$sp	29	stack pointer	yes
\$fp	30	frame pointer	yes
\$ra	31	return address (hardware)	yes

What is MIPS?

- MIPS Technologies, Inc. see: <http://www.mips.com>
 - MIPS (originally an acronym for Microprocessor without Interlocked Pipeline Stages)
 - Instruction Set Architecture (ISA)
- 32- and 64-bit RISC (Reduced Instruction-Set Computing) microprocessor architectures and cores for embedded systems.
 - license intellectual property and computer architecture.
 - Used in: Sony PlayStation 1, 2, 3, Cisco routers, HP laser printers, embedded industrial controllers, broadband and cable hardware, satellite hardware, DVD products, and many more.

Instruction Set Architecture

- A very important abstraction
 - Interface between hardware and lowest level software
 - Standard instructions, machine language bit patterns, etc.
 - Advantage: different implementations of the same architecture
[Binary compatibility]
 - Disadvantage: sometimes prevents using innovations
[Fit into the ISA]

Undertake assembly programming tasks at the **HW/SW interface**

Simulation, SPIM, PC Spim

- Better environment
 - building, testing new systems easy
 - easily modified (changes only in software!)
 - detect more errors
 - provide debugging features not available in raw hardware
- Useful tool for studying computers, designing new computers
 - PCSpim/QtSpim - a simulator of the MIPS processor
 - The classic **PCSpim** isn't outdated; rather its operation style helps reveal many technical details.
 - You have free choice of other simulators though.
 - prepare assembly language programs with a TEXT EDITOR
 - You will use it in each lab to run and debug your programs.
- Disadvantages: it is not the real thing

Example: C program

```
/* actual start of the main program */
/* to print "Hello World" */

main ()      /* function name (no arguments) */
{           /* opening brace is used */
           /* to delimit body of function */
    printf ("Hello World"); /* one statement */
}           /* closing brace is used */
           /* to delimit body of function */
```

... would this be also OK:

```
main () { printf ("Hello World"); }
```

SPIM Program No 1 - Very Simple

- code similar to lab 1
- only two comments (# ...)

```
.text                # what to do
.globl main

main:

li $v0, 4
la $a0, hello
syscall

.data                # data to be used to do it
.globl hello

hello: .asciiz "Hello World"
```

SPIM Program No 1 - a bit better

- # comments!

```
.text          #
.globl main    #
main:          #
    li $v0, 4   #
    la $a0, hello #
    syscall    #

.data          #
.globl hello   #
hello: .asciiz "Hello World" #
```

SPIM Program No 1 - best version

- # comments!

```
# Actual start of the main program to print "Hello World"
```

```
.text
```

```
.globl main          # note 'globl' directive
```

```
main:                # main has to be a global label
```

```
    addu $s7, $0, $ra    # save the return address in ra
```

```
# Output the string "Hello World" on separate line
```

```
.data                # note 'data' directive
```

```
.globl hello
```

```
hello: .asciiz "\nHello World\n"    # string to print
```

```
.text                # note 'text' directive
```

```
li $v0, 4            # print_str (system call 4)
```

```
la $a0, hello        # takes string address as argument
```

```
syscall
```

```
# Usual stuff at the end of the main
```

```
addu $ra, $0, $s7    # restore the return address
```

```
jr $ra               # return to the main program
```

SPIM Program No. 1 – in PCSpim

Overview: Programs for SPIM

- comments start with “#”
- some lines start with “.”
 - assembler directives
 - some directives have parameters
- some lines start with a letter
 - assembler instructions (or pseudoinstructions)
 - mostly have parameters separated by commas
 - some parameters start with “\$” (registers)
 - instruction names are reserved keywords
- labels are terminated with “:”
 - label is a symbol corresponding to a specific memory address

Overview: Some assembler directives

- `.text`
 - the instructions to execute
- `.data`
 - the data in memory
- both can be used as many times as needed
 - the assembler will combine all instructions in one predefined area of memory,
 - and all data in another predefined area of memory

Overview: Data directives

- `.byte b1, b2, ... , bn`
 - store values `b1, b2 ...` in `n` successive locations of memory
- `.word w1, w2, ... , wn`
 - as above for words
- `.space n`
 - allocate `n` bytes of space in memory
- `.ascii "string"`
 - store string in memory
- `.asciiz "string"`
 - store string in memory followed by a null byte ie. a byte containing all zeros (00000000)

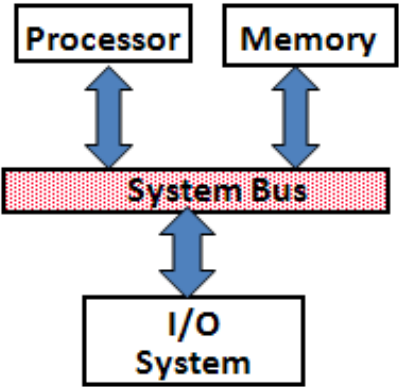

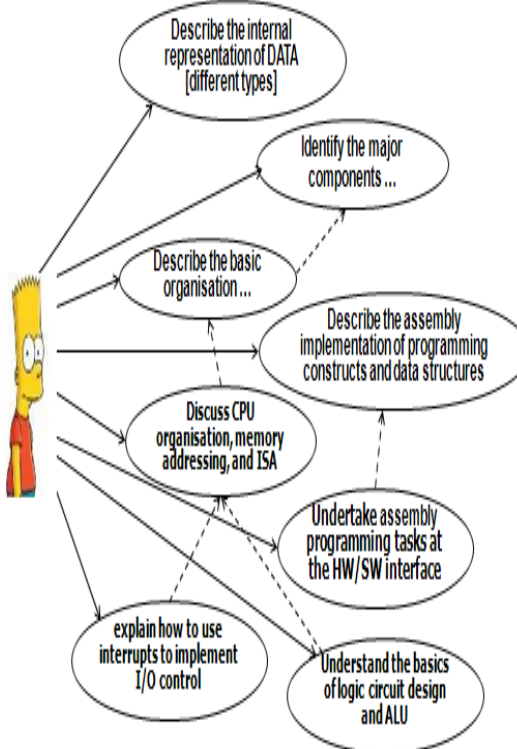

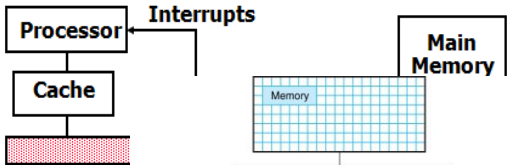

Overview: Other directives

- `.kdata` and `.ktext`
 - relate to special instructions and data accessible in privileged mode only
- `.globl abc`
 - declares symbol `abc` as global, so it can be used in other files

Revision: A top-down view of computer organisation

- A top-down view

Before the next lecture and first lab

■ Recommended reading:

- Text readings are listed in **Teaching Schedule** and Learning Guide
- HP6, HP5, HP4 chap 1 "Computer Abstractions and Technology"
- HP6, HP5, Appendix A, part A.9; HP4, Appendix B, part B.9; or part A.9 of **HP_AppA.pdf** on vUWS.

General Data	UnitOutline LearningGuide Teaching Schedule Aligning Assessments 
Extra Materials	ascii_chart.pdf bias_representation.pdf HP_AppA.pdf instruction_decoding.pdf masking_help.pdf PCSpim.pdf PCSpim Portable Version Library materials

■ Recommended: get Spim Simulator, install it on ur machine

- run the simplest "program No 1" which prints text on screen, experiment with options, observe what PCSpim/QtSpim does
- make some changes: different text, new lines (\n), enter a nonexisting instruction and observe 'parser error'
- get instructions for lab 1, study all recommended materials
- do some lab 1 tasks before the lab.
